1662. EPIDEMIOLOGY AND PROPHYLAXIS OF INFLUENZA AMONG SCHOOL-
CHILDREN (Russian text) - Slepushkina V. G. - VOPR. VIRUSOL.

1957, 4 (224-228) Graphs 2 Tables 2

The incidence of influenza was considerably higher in children of younger school age (7-12) than in older children (12-17). One of the reasons of the higher incidence is the low level of immunity in younger children. Children of school age are the main source of the appearance and spread of influenza in households both in epidemic and interepidemic periods. The infection is spread among schoolchildren mainly by direct contact. Of grown-up members of the family mothers play a great part in the spread of influenza. Influenza vaccine was administered for the prophylaxis of influenza at school. The reactivity of the vaccine was found to be insignificant. In the group of younger children the incidence of influenza was 1.8-1.9 times lower, in the group of older children 1.6 times lower than in the unvaccinated groups. (XVII, 7)

AUTHOR: Slepushova, L. I., Candidate of Technical Science
TITLE: Factors Influencing the Transfer of Carbon into Pig Iron
(Faktory, vliyayushchiye na perekhod ugleroda v chugun)
PERIODICAL: Stal', 1958, Nr 4, pp 298-300 (USSR)

ABSTRACT: Possible causes of the variability of carbon concentration in pig iron are discussed. The supposition that the reducibility of the burden has a direct influence on the degree of carbon saturation was tested on a small blast furnace (142 m³ working volume). It was found that on replacing easily reducible ores by less reducible the concentration of carbon in pig iron decreased. High carbon concentration in pig iron (4.3 to 4.8%) produced in Magnitogorsk blast furnaces is explained by a high reducibility of their burden consisting of self-fluxing sinter. A similar increase in the concentration of carbon in pig iron was also observed on the Krivoy Rog Works on transfer of furnaces to self-fluxing sinter. It is pointed out that the control of carbon content in iron by suitable adjustment of burden reducibility can have only a limited application, therefore, when a low carbon content is required some decarburising treatment outside

TITLE: The conditional separation of spatial and angular variables in the solution of the neutron transfer equation
19.44.55

SOURCE: Atomnaya energiya, v. 19, no. 6, 1965, 540-542

TOPIC TAGS: nuclear reactor technology, approximate solution, neutron

ABSTRACT: The conditional separation of variables was successfully used in the past for the solution of the two-dimensional spacial diffusion problem. The basic ideas of this method may also be used for the approximate solution of the neutron transfer equation. The present authors develop a new approach to a special example of solid angle distribution determination in a plane parallel layer in the single velocity approximation. The results show the critical size and neutron distribution of a unidimensional reactor. They compare favorably with the results of the known P_n and S_n methods and the results obtained by G. Metsis (Nucl. Sci. and Engng, 17, 55, 1963). The new method should be especially effective in the design of so-called small nondiffusion systems where the conventional method leads to substantial errors. The realization of the new method on electronic computers can be carried out using programs

TITLE: Application of Fourier series to the investigation of deformation waves

SOURCE: Prikladnaya mekhanika, v. 1, no. 8, 1965, 112-119

TOPIC TAGS: elastic deformation, wave propagation, Fourier series

ABSTRACT: Unsteady deformation processes are studied where the deforming regions expand in time. It is shown that local deformations can be described by Fourier series of the form

$$F(x, t) = \frac{1}{2U(t)} \sum_n f\left(\frac{n\pi}{U(t)}, t\right) e^{-i\frac{n\pi x}{U(t)}} \delta_0(U(t) - |x|). \quad (1)$$

where $F(x, t) = 0$ at $|x| \geq U(t)$. An example is given for the equation of motion described by

$$m\ddot{u} - c^2 m u'' + k u = Q \delta_1(x) \delta_0(t) \quad (2)$$

$$\delta_1(x) = \delta_0(x) = \frac{d\delta_0(x)}{dx}$$

Card 1/3

L 2600-56

ACCESSION NR: AP5022218

To solve the general problem of unsteady deformation, the continuity equation and equation of motion

$$\rho + \partial_t(\rho v) = 0; \\ \Phi_k = (\rho v_k) + \partial_t(\rho v_k p_k) - \partial_t \sigma_{jk} = F_k. \quad (3)$$

are multiplied by $\exp(iq_j x_j)$ and integrated over the volume $|x_j| < L_j$. At time $t = t^*$, the local deformation is described by

$$\iiint_{\Omega} \Phi_k \frac{\partial u_k}{\partial L_m} dx_1 dx_2 dx_3 = \iiint_{\Omega} F_k \frac{\partial u_k}{\partial L_m} dx_1 dx_2 dx_3. \quad (4)$$

after making use of the above continuity equation and the equation of motion. This last equation (4) describes L_m as a function of time and the expansion number N . As a specific example, the following concentrated load is assumed

$$P(t) = Q_0 \left(\frac{t}{t_0} \right)^k, \quad k > 0, \quad (5)$$

and, by using the above analysis, the longitudinal and flexural deformations are calculated. Orig. art. has: 35 equations and 4 figures.

TITLE: On the interaction between an infinite plate and an ideal fluid at impact

SOURCE: Inzhenernyy zhurnal. Mekhanika tverdogo tela, no. 6, 1966, 44-49

TOPIC TAGS: compression shock wave, Fourier transform, elastic fluid, ideal fluid, fluid surface, fluid flow

ABSTRACT: The dynamic deformation of a plate laying on the surface of an ideal elastic fluid and subjected to the action of a punch of finite width is considered. The calculations were performed on a computer. Specific cases of the problem were solved before, but it is noted that numerical results are rather complex to obtain and the qualitative data cited in previous references appear to be erroneous. In this approach, a series with a variable distribution interval, rather than the Fourier transform, was used; the time variable distribution interval was identified with the interval containing the excitations. It was found that the force (Q), which counteracts the motion of the punch, equals the rate of the quantity of the motion of the fluid and of the plate. Its nondimensional magnitude

$$Q_0 = \frac{Q}{mc_0 v_0} = 2b + 2 \int_{-\infty}^{t_f} \left(\frac{\partial w}{\partial \tau} + \frac{\partial^2 w}{\partial \tau^2} \right) d\eta$$

Card 1/2

ACC NR: AP7002690

where m is the mass of the plate per unit area, and ρ_0 , c_0 are the mass density and speed of sound in a fluid, v_0 is the speed of the stamp and

$$|n| \leq l_0 + l_1$$

is the series in a variable interval. Several additional specific examples are considered, including the effect of the compressibility of the fluid and the inertia of the membrane. The developed equations and graphs indicate that the compressibility of the fluid does not have a substantial effect upon the interaction forces, provided that the flexural waves of the deformed construction are considerably shorter than the compression waves in the fluid which they excite, and provided that the flexural waves do not affect the volume of the fluid. Orig. art. has: 5 figures, 29 formulas.

TITLE: Population Changes in the Rumanian People's Republic in Connection With Industrialization (Izmene-niya v naselenii Rumynskoy narodnoy respublikи v svyazi s industrializatsiyey)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya geografiche-skaya, 1959, Nr 1, pp 98-103 (USSR)

ABSTRACT: This article presents a general picture of population changes as to numbers, social and residential shifts, enlargement of number and size of towns, based on the data obtained by the general census of the population of Rumania taken on 21 February 1956. It contains some detailed data on population changes by separate localities, towns and districts, and summary data. There are 4 tables and 2 maps.

Determination of coefficients of heat evolution during condensation of vapor of Freon-12 on smooth and finned tubes. E. Slepyan (Bauman Tech. School, Moscow). *Kholodil'naya Promst.* 29, No. 1, 53-8(1952).—Condensation of Freon-12 vapor over a wide temp. range (20-80°) has film character, and the film flow in all kinds of tubes has wave nature. Change of the flow characteristics does not alter the thermal coeff. In smooth horizontal tubes the theoretical formula suggested by Nusselt gives good results in calcn. of the thermal coeffs. Modifications of this formula are given for finned horizontal tubes. G. M. Kosolapoff

Title. THE USE OF SCINTILLATION DETECTORS (COUNTERS) IN THE DOSIMETRY OF FAST NEUTRONS

Periodical: *Referativnyy zhurnal, Mashinostroyeniye*, no. 5, 1962, 65, abstract 32.5.361 (*Tr. in-tov Kom-ta standartov, mer i izmerit, priborov pri Sov. Min-SSSR*, no. 55 (115), 1961, 74-80)

Text: In order to design a scintillation dosimeter for fast neutrons, the ВНИИМ-ВНИИМ (Vseseoyuznyy nauchno-issledovatel'skiy institut metrologii im. D. I. Mendeleyeva [All-union Research Institute of Metrology im. D. I. Mendeleyev]) investigated scintillation counters for measuring the flow of fast neutrons. Fine-grained silver-activated zinc sulfide (maximum de-excitation intensity over a wave length range from 4500 to 5200A) was used as a scintillator. By means of a solution of organic glass in dichloropetane, the scintillation was applied to the proton radiator. Description of multilayer and spherical scintillation detectors is given. The multilayer detector consists of organic glass lamellas, 1.5 mm thick (which form the proton radiator and radiation conductor) provided with scintillating interlayers having a specific thickness of 7 mg/cm². The proton radiator of the spherical detector consists of tissue-equivalent plastic layers the internal surface of which is coated with a scintillating layer having a specific thickness of 20 mg/cm². Both types of detectors

were fastened to a ФЭУ-19 (FEU-19) photomultiplier and assembled with a standard unit comprising an amplifier, a "Sirene"-type discriminator and a ПС-10,000 (PS-10,000) counting device. The above detector permitted the measurement of the neutron flow from a (P_0 - α -Be) source. As shown by the tests, the multilayer detector gives an accuracy of $\pm 10\%$ in the measurements of neutrons having an energy of 0.2 to 5 Mev (starting from a dose intensity of 0.1 microrontgen/sec) while the spherical detector allows the measurements of fast neutrons having a density of more than 10 neutrons/cm². sec) with an accuracy range from ± 10 to 15%. Although both devices have a satisfactory sensitivity to fast neutrons, their indications, while on the one hand depending on the direction of propagation of neutrons, depend on the neutron energy only over a narrow energy range. This constitutes the main shortcoming of both devices. There are 11 figures and 21 references.

AUTHOR: Sles', I.S., Candidate of Biological Sciences

TITLE: The Breeding of the Wild Horse in Captivity

PERIODICAL: Priroda, 1959, Nr 5, pp 53 - 55 (USSR)

ABSTRACT: The author describes Equus przewalskii as similar in appearance to Equus hemionus, but genetically akin to the domestic horse. The hybrids obtained from cross breeding between Equus hemionus and the domestic horse (at Askaniya Nova) were all sterile, while hybrids from cross breeding between Przewalski Horse and the domestic horse yielded offspring. The voice of the Equus hemionus-Equus domesticus hybrid is similar to Equus hemionus, while the voice of the wild horse - domestic horse hybrid is the same. The wild horse is a strong, hardy and unpretentious animal, producing similar qualities through cross breeding. Several specimens of them existed at Askaniya Nova in 1905, but the capturing of fresh specimens in the Dzhungaria Desert is very diffi-

TITLE: Mechanism of low-carbon steel fracture

SOURCE: Kovove materialy, no. 4, 1965, 394-407

TOPIC TAGS: material fracture, plastic deformation, low carbon steel, crystal structure, pearlite, ferrite, ultimate strength, tensile strength, metallurgical testing machine

ABSTRACT: The fracture of cylindrical specimens was studied by direct observation of plastic deformations in a tensile-testing machine designed by the authors [Abstracter's note: description of the testing machine is not given]. The experiments were made with low-carbon steel having coarse-granular polyhedral ferrite-pearlite microstructure. Conventional stress-strain diagrams were plotted during the tests. The first microcracks were formed under the stresses in the

Card 1/2

L 26025-66
ACC NR: AP5025476

region of ultimate tensile strength somewhat before or after reaching the point of ultimate strength. In 99% of the cases, the microcracks were generated in the pearlite grains either in the core with subsequent penetration to the periphery in the form of lenslike microfracture or on the edges of the grains with spreading to the center in the form of a broken line. The cracks in the pearlite grains were formed either perpendicularly to or at an angle to the lamellas, and in only one per cent of the cases were the cracks formed along the planes of the lamellas. An additional increase in tensile stress resulted in further propagation of a part of the cracks, whereas in the other part of the cracks the crack development was arrested at some definite degree of deformation. New microcracks began to form again simultaneously, mostly in the pearlite grains. The growth of the cracks was accompanied by the strong localized deformations in adjacent grains. In the last stages of fracture a narrow continuous region of an intensive plastic deformation was formed. The growth and joining of microcracks into the final surface of the fracture occurred in this region. Orig. art. has: 26 fig.
